

Rudy's Retro Intelligence

Apple IIe Personal Computer Diagnostics and Repair Manual

The purpose of this manual is help diagnose and repair the Apple IIe computers and is based on my work from over the years of repairs and input from others. Future versions will be available as more information is collected, tested and verified.

Included is the diagnostic section with suggested repairs based on the conditions present. Diagrams and pinouts are also provided. Schematics for the Apple IIe computer itself can be found online and are **not** included here as there are some differences between revisions of the motherboard.

For Apple IIe clone computers, the diagnosis should work on these computers, however the placements of the IC and other parts may not line up with the diagram at the end of this documentation. You will have to do some additional research.

For the latest version of this document and other Apple II\II+ related information, use the links below.

<https://github.com/RudyRetroIntel/Vintage-Computer-Diagnostics>

You can find my video on the monitoring board here.

*"Sharing knowledge, so we can ensure that the Apple IIe computer can be repaired and enjoyed now and into the future.
Rudy's Retro Intel"*

***** This document is based on the work I have performed on my Apple IIe computer and is provided "as is". I\we do not take any responsibility for errors and\or damages that may occur when repairing your Apple IIe computer. This information is provided freely to all Apple IIe computer owners. Please ensure you know how to perform electronics\electrical work. If not, please contact someone who has these skills before starting. *****

Manufacturer	Apple Computer Co. 1983
Processor	CPU MOS Technology/SynerTek 6502
Speed	1.02Mhz
ROM	16K or 32K
Onboard RAM	64KB
Max RAM	128KB with 80 column card
Number of slots	8
Operating System	DOS 3.3, ProDOS and CP/M with Z80 card
Max video resolution	Apple II video: 140x192, 280x192 and others, 16 colors, TV or composite monitor
Input\Output	Serial and Parallel
Speaker	Mono speaker
Diagnostic Software	Apple-Cillian II - XPS Inc Apex II XPS Diagnostics IIe Apple IIe Diagnostics V2.1

Note. After repairs are completed, always run the diagnostic software and loop through all the tests as there may be other issues with the computer. Recommend that tests run at least 10 times without errors

Apple IIe Built in Diagnostics

To start the test, both the closed and the open Apple keys must be pressed during boot. It is also possible to press the closed apple while pressing the CONTROL-OPEN APPLE-RESET keys to start the test at any time. The test is also performed automatically if the keyboard is detached when the computer boots.

Tests performed: Following components are tested:

Main RAM and aux. RAM.
MMU
IOU
GLU

If a problem is detected at any point of the test sequence the test stops and a failure message is displayed

Interpreting the results

If the MMU, IOU or the GLU are detected as faulty, the corresponding component name is displayed. RAM Chips are tested sequentially starting with the least significant bit of main RAM and working through the most significant bit. Then the auxiliary RAM is tested.

A RAM fault is shown as a 1 in a series of zeroes. The faulty RAM chip corresponds to the bit position of the 1. This means the rightmost number corresponds to the memory chip labeled as MDR0 for the main RAM

A fault on the auxiliary RAM is indicated with an asterisk. A fault on the first 255 bytes of ram is additionally marked with a ZP which stands for zero pointer.

When finished a SYSTEM OK message or KERNEL OK (Apple IIe Enhanced) appears.

****** NOTE **** Built in RAM test display is backwards, so to locate bad RAM indicated, you must have the slots of the board nearest to you. If you view with slots farthest from you, you will replace the wrong RAM IC**

Card configuration - Viewed left to right from power supply

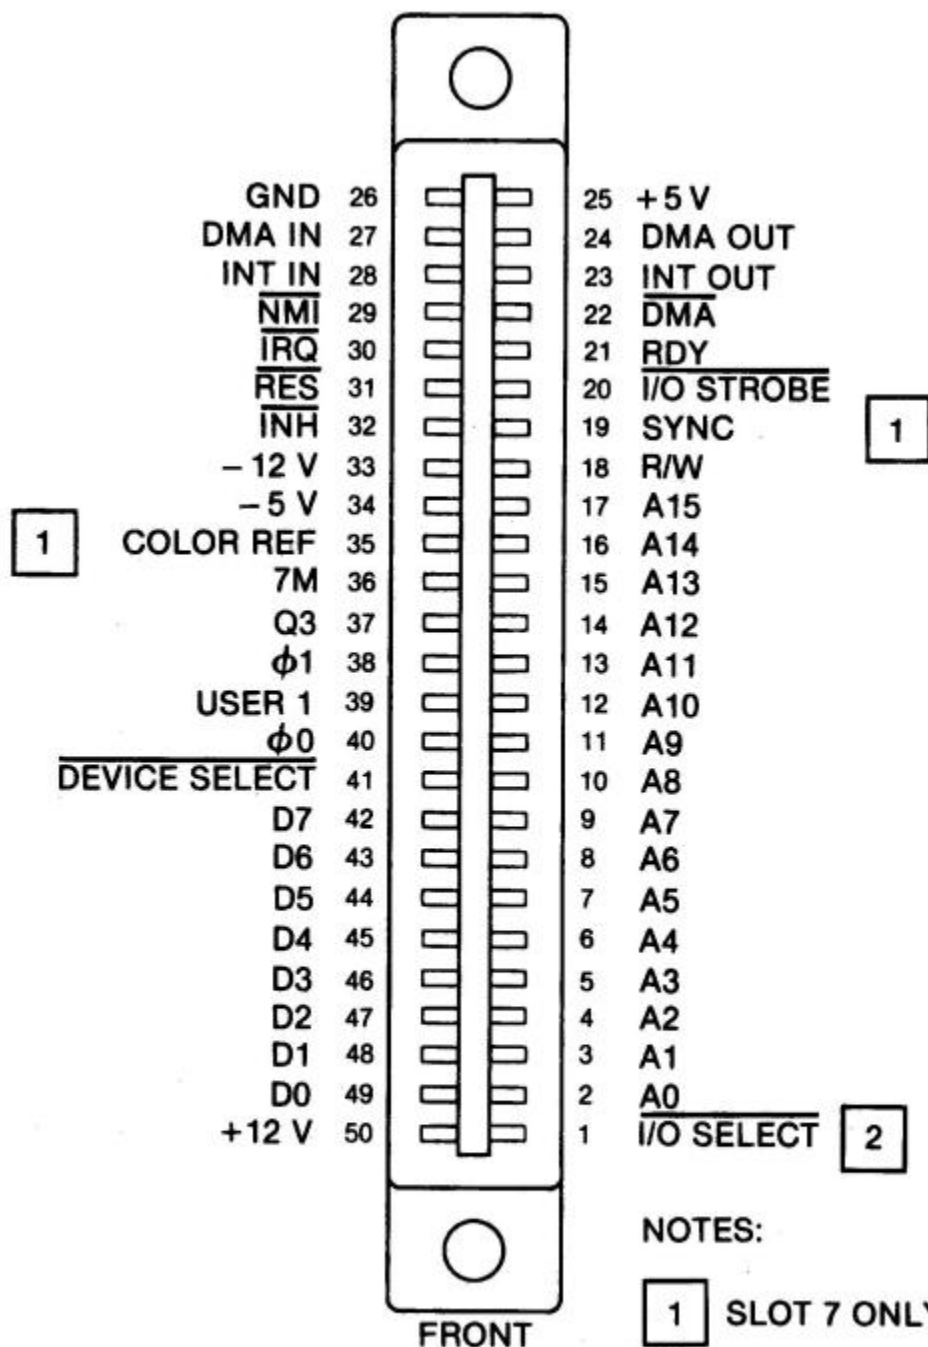

Auxiliary Slot	80 Column Card
Slot 1	Printer Card
Slot 2	Modem or Serial Card
Slot 3	80 Column Card
Slot 4	CP/M Card
Slot 5	Disk Drive Card 3 and 4
Slot 6	Disk Drive Card 1 and 2
Slot 7	Disk Drive Card 5 and 6

Quick Bad IC Connection Repair

Sometimes the Apple II series computer has a bad connection issue with the chips and the sockets. Before you start your diagnostics, open the computer and re seat all the chips. This is done by pressing down on all the chips to re seat them. You may hear a small cracking sound which is normal. Once done try to boot up the computer. Chips can get loose in the socket over time due to heat.

Peripheral Connector Signal Description

<i>Signal</i>	<i>Description</i>
<u>I/O SELECT</u>	This line, normally HIGH, becomes LOW when the MPU references page \$Cn, where n is the slot number.
A0-A15	Buffered address bus.
<u>R/W</u>	Read/Write signal.
<u>SYNC</u>	On peripheral connector 7 only, connected to video timing generator's SYNC signal.
<u>I/O STROBE</u>	This line goes LOW during $\Phi 0$ when the address bus contains an address between \$C800 and \$CFFF.
<u>RDY</u>	RDY input on 6502.
<u>DMA</u>	Pulling this line LOW disables the 6502's address bus and halts the MPU.
INT OUT	Daisy-chained interrupt output to lower priority devices.
DMA OUT	Daisy-chained DMA output to lower priority devices.
+5v	+5v power supply. 500 ma is available for all peripheral devices.
GND	System ground.
DMA IN	Daisy-chained input from higher priority devices.
INT IN	Daisy-chained input from higher priority devices.
<u>NMI</u>	Nonmaskable interrupt.
<u>IRQ</u>	Interrupt request.
<u>RES</u>	System reset input.
<u>INH</u>	When this line is pulled LOW, all ROMs on Apple board are disabled
-12v	-12v power supply. Maximum current for all peripheral boards is 200 ma.
-5v	-5v power supply. Maximum current for all peripheral boards is 200 ma.
COLOR REF	On connector 7 only, this pin is connected to color reference signal.
7M	7 MHz clock.
Q3	2 MHz asymmetrical clock.
$\Phi 1$	MPU's phase one clock.
USER 1	This line, when pulled LOW, disables all internal I/O address decoding.
$\Phi 0$	MPU's phase 0 clock.
<u>DEVICE SELECT</u>	This line becomes active LOW on each peripheral connector when the address bus is holding an address between \$C0n0 and \$C0nF, where n is the slot number plus \$8.
D0-D7	Buffered bidirectional data bus.
+12v	+12v power supply. Maximum current for all peripheral boards is 250 ma.

NOTES:

1 SLOT 7 ONLY

2 SLOTS 1-7 ONLY

Apple IIe Symptoms and Diagnostics

Read the symptoms column and find the condition present. Next read across the row for the diagnostics.
